Sec No-8	Team No-11	Project Title- E-Prescription and Medicine Reminder App
-----------------	-------------------	--

1. Abstract

The E-Prescription and Medicine Reminder App is a digital healthcare solution designed to simplify prescription management and help patients follow their medication schedules effectively. Traditional paper-based prescriptions can be misplaced, damaged, or difficult to understand, while patients may also forget medicine timings or doses. This application addresses these challenges by providing a centralized platform for managing prescriptions and medicine reminders.

The system allows doctors or authorized healthcare providers to create electronic prescriptions containing essential details such as medicine name, dosage, frequency, duration, and instructions. Patients can securely access their prescriptions through the application and view their medication schedules in an organized format. A medicine reminder feature sends timely notifications to help patients remember when to take their medicines. The application can also maintain prescription history, allowing users to refer to previous prescriptions when required.

The proposed system aims to reduce medication errors caused by unclear handwriting, forgotten doses, or misplaced prescriptions. It improves communication between healthcare providers and patients by making prescription information easily accessible in digital form. The application can also provide basic medicine information and allow users to search for medicines within their records.

2. Team Details

Roll Number(s)	Name of the Student	Signature
2520030580	Likhitha .B	
2520030168	Keerthana.G	
2520030144	Chinmayi Seshna.V	

3. Frameworks / Platforms / Software Used

- **HTML** – Used to create the structure of the application.
- **CSS** – Used for designing and styling the user interface.
- **JavaScript** – Used to implement interactive features and application logic.
- **React.js** – Used to develop the frontend and user interface.
- **Node.js** – Used to develop the backend of the application.

- **Express.js** – Used to create server-side APIs and handle requests.
- **MongoDB** – Used to store patient details, prescriptions, medicine information, and reminder schedules.
- **Visual Studio Code** – Used as the primary development environment.
- **Postman** – Used for testing backend APIs.
- **Git/GitHub** – Used for version control and project management.
- **Google Chrome** – Used to run and test the web application.
